MODEL CALCULATIONS OF SHORT-TERM FORECASTS OF RUSSIAN ECONOMIC TIME SERIES

11/2021

GAIDAR INSTITUTE FOR ECONOMIC POLICY

M.Turuntseva, E.Astafieva, M.Bayeva, A.Bozhechkova, A.Buzaev, T.Kiblitskaya, Yu.Ponomarev and A.Skrobotov

INTRODUCTION TO ALL THE ISSUES

This paper presents calculations by researchers at the Gaidar Institute[1] of economic indicators derived from time series models for the period *over December of 2021 to May of 2022*.[2] The forecasting method belongs to the group of *formal* or *statistical* methods. In other words, the calculated values neither express the *opinion* nor the *expert evaluation* of the researcher, but rather, they are calculations of future values for a specific economic indicator derived by formal ARIMA(p, d, q)-models, given a prevailing trend and divergences, in some cases, by a significant amount. The forecasts here are inertial in nature because the respective models rely upon the dynamics of the data registered prior to the moment of forecasting and depend too heavily on the trends, which are typical of the time series in the period immediately preceding the forecasted time horizon. These calculations of future values of economic indicators for the Russian Federation can be used in making economic policy decisions, provided that the general trends that were observed prior to forecasting for each indicator remain the same, i.e. prevailing long-term trends will see no serious shocks or changes in the future.

Despite that there is a great deal of data available on the period preceding the crisis of 1998, models of forecasting were analyzed and constructed using only the time horizon which followed August 1998. This can be explained by the findings of previous studies[3], which concluded, among other key inferences, that the quality of forecasts deteriorated where data on the pre-crisis period was used. Additionally, it currently seems incorrect to use even shorter series (following the crisis of 2008), because statistical characteristics of models based on such a short time horizon are very poor.

Models for the economic indicators in question were evaluated using standard methods of time series analysis. Initially, the correlograms of the studied series and their first differences were analyzed in order to determine the maximum number of delayed values to be included in the specifications of a model. Then, the results of analyzed correlograms served as the basis for testing all the series for weak stationarity (or stationarity around the trend) using the Dickey–Fuller test. In some cases, the series were tested for stationarity around the segmented trend using Perron and Zivot–Andrews tests for endogenous structural changes.[4]

The series were broken down into weak stationary, stationary near the trend, stationary near the trend with structural change or difference stationary, and then models, which corresponded to each type (regarding the levels and including, if necessary, the trend or segmented trend or differences), were evaluated. The Akaike and Schwartz information criteria, the properties of models' residuals (lack of autocorrelation, homoscedasticity and normality) and the quality of the in-sample-forecasts based on these models were used to choose the best model. Forecast values were calculated for the best of the models constructed for each economic indicator.

Additionally, the Bulletin presents future monthly values of the CPI, calculated using models developed at the Gaidar Institute and volumes of import/export estimates between all countries, calculated using structural models (SM). Forecast values based on structural models may, in some cases, produce better results than ARIMA-models do, because structural models are constructed by adding dynamics of exogenous variables. Besides, the use of structural forecasts in making aggregated forecasts (i.e. forecasts obtained as average value from several models) may help make forecast values more accurate.

Kiblitskaya, *Qualitative Properties of Different Approaches to Forecasting of Social and Economic Indexes of the Russian Federation*. Moscow, IET, 2010.

[2] Given that from early 2019 Rosstat does not release monthly data on indexes of real disposable cash income of the population, commencing from issue 8/2019 we release forecasts in quarter terms for 2 quarters ahead.

[3] Ibid.

[4] See.: Perron, P. Further Evidence on Breaking Trend Functions in Macroeconomic Variables, *Journal of Econometrics*, 1997, 80, p. 355–385; Zivot, E. and D.W.K. Andrews. Further Evidence on the Great Crash, the Oil-Price Shock, and Unit-Root Hypothesis. *Journal of Business and Economic Statistics,* 1992, 10, p. 251–270.

The dynamic Consumer Price Index was modeled using theoretical assumptions arising from monetary theory. The following were used as explanatory variables: money supply, output volume, the dynamics of the ruble-dollar exchange rate, which reflects the dynamics of alternative cost of money-keeping. The model for the Consumer Price Index also included the price index in the electric power industry, because manufacturers' costs rely heavily on this indicator.

The baseline indicator is the real exchange rate, which can influence the value of exports and imports, and its fluctuations can result in changes to the relative value of domestically-produced and imported goods, though the influence of this indicator turns out to be insignificant in econometric models. Global prices of exported resources, particularly crude oil prices, are the most significant factor determining the dynamics of exports: a higher price leads to greater exports. The level of personal income in the economy (labor costs) was used to describe the relative competitive power of Russian goods. Fictitious variables D12 and D01 – equal to one in December and January and zero in other periods – captured seasonal fluctuations. In regard to imports, an increase in personal and corporate incomes triggers higher demand for all goods, including imported ones. Real disposable cash income reflects personal income; the Industrial Production Index reflects corporate income.

Forecast values of foreign exchange rates were also calculated using structural models of their dependence on global crude oil prices.

Forecast values of explanatory variables, which are required for forecasting on the basis of structural models, were calculated using ARIMA(p, d, q)-models.

The paper also estimates values of the Industrial Production Index, the Producer Price Index and the Total Unemployment Index using Gaidar Institute business survey responses. Empirical studies show[1] that the use of business surveys as explanatory variables[2] in forecasting models can make forecasting more accurate on average. Future values of these indicators were calculated using ADL-models (seasonal autoregressive delays were added).

The Consumer Price Index and the Producer Price Index are also forecast using large datasets (factor models – FM). The construction of factor models relies basically on the evaluation of the principal components of a large dataset of socio-economic indicators (112 indicators in this case). The lags of these principal components and the lags of the explanatory variable are used as explanatory variables in these models. A quality analysis of the forecasts obtained for different configurations of the factor models was used to choose a model for the CPI, which included 9th, 12th and 13th lags of the four principal components, as well as 1st and 12th lags of the variable itself, and a model for the PPI, which included 8th, 9th and 12th lags of the four principal components, as well as 1st, 3rd and 12th lags of the variable itself.

All calculations were performed using the Eviews econometric package.

INDUSTRIAL PRODUCTION AND RETAIL SALES

Industrial production

The forecast for December 2021 to May 2022 is based on monthly indexes of industrial production by the Federal State Statistics Service (Rosstat) from January 2002 to September 2021, and on base indexes of industrial production by the National Research University Higher School of Economics (NRU HSE[3]) over the period from January 2010 to October 2021 (the corrected value of January 2010 was equal to 100%). The forecast values of the series were calculated on the basis of ARIMA-class models. The forecasts by Rosstat and the NRU HSE industrial production indexes are calculated using business surveys (BS) as well. The results are shown in Table 1.

---

[1]   See, for example: V. Nosko, A. Buzaev, P. Kadochnikov, S. Ponomarenko. *The Analysis of Forecasting Parameters of Structural Models and Models with Business Surveys' Findings*. Moscow, IEP, 2003.
[2]   Used as explanatory variables were the following series of the business surveys: the current/expected change in production, the expected changes in the solvent demand, the current/expected price changes and the expected change in employment.
[3]   The indexes in question are calculated by E.F. Baranov and V.A. Bessonov.

Mar 21	1,6		1,4		-4,6	-5,0	4,6	4,8	9,3	11,8	0,7	1,0	-3,7	-3,1	-1,7	-0,9	9,7	7,2
Apr 21	7,2		6,6		-1,8	-2,3	14,3	15,1	5,3	4,4	3,5	2,4	4,8	10,8	2,2	1,6	27,0	21,1
May 21	11,9		11,6		12,1	12,1	11,8	11,2	8,1	7,6	4,5	2,3	9,8	15,2	3,2	3,4	15,9	5,5

Note. In the time spans under review, the series of the Rosstat and the NRU HSE chain indexes of IIP, as well as the NRU HSE chain IIP for manufacturing are identified as stationary processes around the trend with an endogenous structural change; the series of the Rosstat and the NRU HSE chain IIPs for manufacturing, for primary metals and fabricated metal products, as well as the NRU HSE chain IIP for mining and Rosstat chain IIP for machinery and equipment are identified as stationary processes around the trend with two endogenous structural changes. The time series of other chain indexes are stationary at levels.

As seen in *Table 1*, the Rosstat industrial production index average[2] gain in December 2021 – May 2022 compared to the same period of the previous year comes to 4.8% in the industry as a whole. The NRU HSE industrial production index comes to 5.0%. At year-end 2021, the projected growth of the Rosstat IPI will come to 1.7%, the NRU HSE IPI will come to 2.1%.

The average monthly gain in the Rosstat and the NRU HSE industrial production indexes for mining and quarrying amounts to 9.4% and 9.2% respectively in December 2021 – May 2022.

The average gain in the Rosstat industrial production index for manufacturing industry in December 2021 – May 2022 amounts to 5.5% compared to the same period of the previous year and the NRU HSE industrial production index for manufacturing industry comes to 3.3%. The monthly gain in the industrial production index for production of food products will average 2.5% and 1.6% for the Rosstat and the NRU HSE indexes, respectively. The production of coke and petroleum products average gain is forecast at 3.0% and 8.9% for the Rosstat and the NRU HSE indexes, respectively. The average monthly change in the industrial production index for primary metals and fabricated metal products for December 2021 – May 2022 computed by Rosstat and the NRU HSE constitutes 3.0% and 3.6%, respectively. Manufacturing of machinery and equipment is forecast to grow on average at 12.0% and 9.3% for the Rosstat and the NRU HSE indexes, respectively.

The average decline in the Rosstat industrial production index for electricity, gas and water supply; for air conditioning for December 2021 – May 2022 constitutes 1.2% in comparison with the same period of the previous year; the same indicator for the NRU HSE industrial production index comes to 6.1%.

On average (according to types of economic activity) the Rosstat industrial production indexes will gain 0.9% in 2021 and the NRU HSE industrial production indexes 1.5%.

---

1   It is to be noted that for making of forecasts so-called "raw" indexes (without seasonal and calendar adjustment) were used and for that reason in most models existence of the season factor is taken into account and, as a consequence, the obtained outputs reflect the seasonal dynamics of the series.
2   Average growth of industrial production indexes is the average value of these indexes for six months under review.

Retail Sales

This section (Table 2) presents forecasts of monthly retail sales made on the basis of monthly Rosstat data over January 1999 to October 2021.

As seen in *Table 2,* the average forecast gain in the monthly turnover for December 2021 – May 2022 against the corresponding period of 2020–2021 amounts to around 12.2%. The average forecast gain in the monthly real turnover for the period December 2021 – May 2022 compared to the same period of 2020–2021 constitutes 1.8%.

In 2022 y-o-y, change in retail trade turnover is forecast at 13.5% in nominal terms, and real terms – at 8.9%.

FOREIGN TRADE INDEXES

Model calculations of forecast values of the export, export to countries outside the CIS and the import, import from countries outside the CIS were made on the basis of the models of time series and structural models evaluated on the basis of the monthly data over the period from September 1998 to September 2021 on the basis of the data released by the Central Bank of Russia.[1] The results of calculations are presented in Table 3.

Table 2
Calculations of forecast values of retail sales and real retail sales

Month	Forecast value according to ARIMA-model	
	Retail sales, billion RUB (in brackets – growth on the respective month of the previous year, %)	Real retail sales (as % of the respective period of the previous year)
Dec 21	4086,9 (13,5)	102,4
Jan 22	3283,4 (16,2)	98,3
Feb 22	3243,6 (16,6)	101,7
Mar 22	3520,2 (15,0)	103,9

May 21	34,9				26,3				30,0				22,0			

Note. Over the period from January 1999 to September 2021, the series of exports, imports, exports to the countries outside the CIS and imports from the countries outside the CIS were identified as stationary series in the first-order differences. In all the cases, seasonal components were included in the specification of the models.

---

[1] The data on the foreign trade turnover are calculated by the CBR in accord with the methods used to derive the balance of payment in prices of the exporter-country (FOB) in billion USD.

Export, import, export outside the CIS and import from the countries outside the CIS are forecast to grow on average by 42.5%, 9.1%, 47.7% and 21.1%, respectively for December 2021 – May 2022 against December 2020 – May 2021. The average forecast trade balance volume with all countries for December 2021 – May 2022 will total $130.9 bn, which corresponds to 2.2-fold increase against December 2020 – May 2021.

PRICE DYNAMICS

The Consumer and Producer Price Indexes
This section presents estimates of forecast values of the consumer and producer price indexes (including both the industry in general and some branch activities under the National Industry Classification Standard (NICS)) derived from time-series models from Rosstat data for the period from January 1999 to September 2021.[1] Table 4 presents the results of model calculations of forecast values from December of 2021 to May of 2022 by ARIMA-models, structural models (SM) and models computed with the help of business surveys (BS).

Table 4
Calculations of forecast values of price indexes

Month	The consumer price index (ARIMA)	The consumer price index (SM)	The consumer price index (FM)	Producer price indexes:														
				for industrial goods (ARIMA)	for industrial goods (BS)	for industrial goods (FM)	for mining and quarrying	for manufacturing	for utilities (electricity, water, and gas)	for food products	for textile and sewing industry	for wood products	for pulp and paper industry	for coke and refined petroleum	for chemical industry	for basic metals and fabricated metal	for machinery and equipment	for transport equipment manufacturing

Apr 21	102,8			113,9			130,9	110,9	102,0	106,7	105,2	110,8	115,6	125,0	122,2	118,4	102,9	104,5
May 21	103,5			116,5			132,7	114,4	102,0	108,0	106,9	116,0	123,3	125,9	130,6	132,1	104,0	104,5

Note. Over the period from January 1999 to September 2021, the series of the chain producer price index for machinery are identified as a stationary process around the trend with two endogenous structural changes. The series of other chain price indexes are stationary at levels.

The forecast average monthly gain in the consumer price index will come to 0.6% in December 2021 – May 2022. The producer price index for industrial goods for the same period is forecast to grow on average at 1.0% per month. The annual gain of the consumer price index according to three models will come to 7.6%, the producer price index is forecast at 26.1%.

---
[1] Structural models were evaluated in the period from October 1998.

The producer price indexes are forecast to gain at an average monthly rate for December 2021 – May 2022: for mining and quarrying 0.8%, for manufacturing 1.5%, for utilities (electricity, gas, and water) 0.8%, for food products 1.2%, for the textile and sewing industry 0.4%, for wood products 2.8%, for pulp and paper industry 2.4%, for coke and refined petroleum 0.9%, for the chemical industry 0.2%, for primary metals and fabricated metal products 1.2%, for machinery and equipment 1.0%, and for transport equipment manufacturing 1.0%.

The average annual growth in producer price indexes by types of economic activity will average at 27.2%. At 2021-end, the maximum annual gain is forecast in wood work and wood products (52.3%) and the minimum – in supply of electricity, gas and water (8.1%).

The Cost of the Monthly per Capita Minimum Food Basket

This section presents calculations of forecast values of the cost of the monthly per capita minimum food basket over December of 2021 to May of 2022. The forecasts were estimated by time series from Rosstat data for January 2000 to November 2021. The results are presented in Table 5.

As can be seen from *Table 5,* the minimum set of food products' cost is forecast to grow compared to the corresponding level of the previous year. At the same time, the minimum set of food products is forecast to average RUB 5,177.6. The minimum set of food products' cost is forecast to grow on average at around 11.0% against the same period of last year. The annual gain in the minimum set of food products will amount to 15.0% in 2021.

Indexes of Freight Rates

This section presents calculations of forecast values of freight tariff indexes on cargo carriage,[1] made on the basis of time-series models evaluated on the Rosstat data over the period from September 1998 to September 2021. Table 6 shows the results of model calculations of forecast values in the December of 2021 to May of 2022. It should be noted that some of the indexes under review (for instance, the index of pipeline tariff) are adjustable ones and for that reason their behavior is hard to describe by means of the time-series models. As a result, the future values may differ greatly from the real ones in case of the centralized increase in tariffs in the period of forecasting or in case of absence of such an increase in the forecasting period, but with it taking place shortly before the beginning of that period.

Table 5
The forecast of the cost of the monthly per capita minimum food basket

Month	Forecast values according to ARIMA-model (RUB)
Dec 21	5125.6
Jan 22	5121.1
Feb 22	5140.3
Mar 22	5185.4
Apr 22	5214.8
May 22	5278.1
For reference: actual values in the same months of 2020–2021 (billion RUB)	
Dec 20	4456.0
Jan 21	4507.4
Feb 21	4583.2
Mar 21	4712.0
Apr 21	4800.2
May 21	4953.1
Expected growth on the respective month of the previous year (%)	
Dec 21	15.0
Jan 22	13.6
Feb 22	12.2
Mar 22	10.0
Apr 22	8.6
May 22	6.6

Note. The series of the cost of the monthly per capita minimum food basket over the period from January 2000 to November 2021 are stationary in the first differences.

According to the forecast findings for December 2021 – May 2022, the composite index of transport tariffs on freight carriage during six months under review will be growing at an average monthly rate of 0.6%. In October 2021, a seasonal decline in the index is expected at -4.5 pp. and in April – a seasonal growth by 3.7 p.p. As a result, its annual gain in 2021 will come to 1.4%.

The index of motor freight tariffs will be growing during these six months at an average monthly rate of 0.1%. Its annual gain in 2021 is forecast at 2.8%.

---

[1] The paper presents a review of the composite freight rate index on freight transport and the motor load freight rate index, as well as the pipeline rate index. The composite freight rate index is computed on the basis of the freight rate indexes by individual types of transport: rail, pipeline, shipping, domestic water-borne, and motor load freight and air service (for more detailed information, pls. refer, for instance, to: *Prices in Russia*. The Official Publication of Goskomstat of RF, 1998).

Table 6
Calculations of forecast values of freight tariffs indexes

Month	The composite index of transport tariff	The index of motor freight tariff	The index of pipeline tariff
Forecast values according to ARIMA-models (% of the previous month)			
Dec 21	100,0	99,9	99,6
Jan 22	99,9	101,4	99,6
Feb 22	99,9	99,9	99,5
Mar 22	99,9	99,9	99,6
Apr 22	103,7	99,9	103,3
May 22	99,92	99,8	103,3
Forecast values according to ARIMA-models (% of December of the previous year)			
Dec 21	101,4	102,8	104,6
Jan 22	99,9	101,4	99,6
Feb 22	99,9	101,2	99,1
Mar 22	99,8	101,1	98,7
Apr 22	103,5	101,0	101,9
May 22	103,4	100,8	105,2
For reference: actual values in the same period of 2020–2021 (% of the previous month)			
Dec 20	99,9	100,1	99,9
Jan 21	103,1	100,9	103,3
Feb 21	100,0	100,3	100,0
Mar 21	100,0	99,8	100,0
Apr 21	103,5	100,5	103,5
May 21	99,9	99,8	99,9

Note. Over the period from September 1998 to September 2021, the freight tariffs indexes were identified as stationary; the other series were identified as stationary over the period from September 1998 to September 2021, too; fictitious variables for taking into account particularly dramatic fluctuations were applied to all series.

Table 7
Estimates of forecast values of world prices of natural resources

Month	Brent oil ($ per barrel)	Aluminum ($ per ton)	Gold ($ per ounce)	Copper ($ per ton)	Nickel ($ per ton)

Dec 20	51.8	2003	1856	7756	16588
Jan 21	55.88	1973	1867	7813	17675
Feb 21	66.13	2163	1808	8993	18563
Mar 21	63.54	2194	1762	8809	16128
Apr 21	67.25	2391	1762	9809	17585
May 21	69.32	2467	1853	10275	18188

Note. Over the peri od from February 1980 to October 2021, the series of prices of crude oil, nickel, gold, copper, and aluminum are series of DS type.

The index of pipeline tariffs will be growing during the next six months at an average monthly rate of 0.8%. In October 2021, a seasonal decline of the index is expected by -0.8 p.p. and in April – a seasonal growth by 3.3 p.p. Its annual gain in 2021 will come to 4.6%.

World Prices of Natural Resources
This section presents estimates of average monthly values of Brent crude prices (US$ per barrel), aluminum prices (US$ per ton), gold prices ($ per ounce), copper prices (US$per ton), and nickel prices (US$ per ton) over December 2021 to May 2022 as were received on the basis of nonlinear models of time series evaluated on the basis of IMF data over the period from January 1980 to October 2021.

The crude oil price is forecast to average around $86.9 per barrel, which is above its corresponding year-earlier indexes on average by 40.8%. The aluminum prices are forecast to stay around $2,782 per ton and their average forecast gain constitutes around 27.0% compared to the same level of last year. The gold price is forecast to average $1,808 per ounce. The copper price is forecast to average $9,944 per ton, and prices for nickel – around $21,095 per ton. The average forecast price drop for gold comes to around 0.5%, increase in prices for copper – around 13.0%, increase in prices for nickel – 21.0% against the corresponding level of last year.

At year-end 2021 compared to the end of 2020, the forecast gain in the crude oil price will stand at 66.4%, aluminum price – 39.2%, copper price – 25.4% and nickel price – 29.5%. Annual forecast drop of gold prices will come to 3.7%.

MONETARY INDEXES

The future values of the monetary base (in the narrow definition: cash funds and the Fund of Mandatory Reserves (FMR) and M_2 monetary aggregate over the period from December 2021 to May 2022 were derived from models of time-series of respective indexes calculated by the CBR[1] in the period from October 1998 to November 2021 for the monetary base and to October for M_2 monetary aggregate. Table 8 presents the results of calculations of forecast values and actual values of those indexes in the same period of the previous year. It is to be noted that due to the fact that the monetary base is an instrument of the CBR policy, forecasts of the monetary base on the basis of time-series models are to a certain extent notional as the future value of that index is determined to a great extent by decisions of the CBR, rather than the inherent specifics of the series.

In December 2021 – May 2022, the monetary base will be growing at an average monthly rate of 0.8%. In January 2022, a seasonal growth of the monetary base is projected at 3.5 p.p. In 2021, the annual gain of the monetary base will come to 7.8% according to forecasts.

In the period under review, the M_2 monetary aggregate index will be changing at an average monthly rate of 0.4%. In January 2022, a seasonal growth of the index is projected at 2.1 p.p. The annual gain of the M_2 index is projected at 8.8%.

INTERNATIONAL RESERVES

This section presents the outputs of the statistical estimation of future values of the international reserves of the Russian Federation[2] as derived from time series modeling of gold and foreign exchange reserves from data released by the CBR over the period from November 1998 to October of 2021. That index is forecast without taking into account a decrease in the amount of reserves due to foreign debt payment and for that reason the values of the volumes of the international reserves in the months where foreign debt payments are made may be overestimated (or otherwise underestimated) as compared to actual values.

Subsequent to the forecast findings for December 2021 – May 2022, the international reserves will be growing at an average monthly rate of 0.7%. In 2021, international reserves are projected to gain 8.0%.

Table 8
The forecast of M_2 and the monetary base

| Month | The monetary base | | M_2 | |
	Billion RUB	Growth on the previous month, %	Billion RUB	Growth on the previous month, %
Dec 21	14381	0,7	61212	0,4
Jan 22	14886	3,5	62520	2,1
Feb 22	14605	-1,9	62208	-0,5
Mar 22	14752	1,0	62520	0,5
Apr 22	14841	0,6	62208	-0,5
May 22	14990	1,0	62519	0,5
For reference: actual value in the respective months of 2020–2021 growth on the previous month, %)				
Dec 20	-0,1		0,4	
Jan 21	3,8		4,5	
Feb 21	-1,7		-1,8	
Mar 21	1,0		1,0	
Apr 21	0,0		0,1	
May 21	2,9		1,6	

Note. Over the period from October 1998 to November 2021, the time series of the monetary base were attributed to the class of series which are stationary in the first-order differences and have an explicit seasonal component and the time series of the M_2 monetary aggregate from October 1998 to October 2021 was identified as a stationary series with an explicit seasonal component.

Table 9
The forecast of international reserves of the Russian Federation

| Month | Forecast values according to ARIMA-model | |
	Billion USD	Growth on the previous month, %
Dec 21	629,7	0,9
Jan 22	634,2	0,7
Feb 22	639,2	0,8
Mar 22	643,3	0,7
Apr 22	647,6	0,7
May 22	651,6	0,6
For reference: actual values in the same period of 2020–2021		
Dec 20	582,7	0,0
Jan 21	595,8	2,2
Feb 21	590,7	-0,9
Mar 21	586,3	-0,7
Apr 21	573,3	-2,2
May 21	590,5	3,0

Note. Over the period from October 1998 to October 2021, the series of the gold and foreign exchange reserves of the Russian Federation were identified as stationary series in difference.

---

[1] Data for a specific month is given, as by the CBR, as of the beginning of the following month.
[2] The volume of the gold and foreign exchange reserves is presented as of the first day of the following month.

FOREIGN EXCHANGE RATES

The model calculations of prospective values of foreign exchange rates (RUB per USD and USD per euro) were derived from time series models (ARIMA) and structural models (SM) of the relevant indicators released by the Central Bank of Russia as of the last date of each month over the periods from October 1998 to November 2021 and from January 1999 to November 2021,[1] respectively.

In December 2021 – May 2022, USD/RUB average exchange rate is forecast according to two models at RUB 75.73 per USD. Actual value will constitute RUB 74.84 per USD by the end of 2021.

Projected Euro/USD exchange rate over the period under review will average USD 1.14 per 1 euro. The index value will constitute USD 1.13 per 1 euro by the end of 2021.

LIVING STANDARD INDEXES

This section (Table 11) presents results of calculations of monthly forecast values of index of real wages, as well as quarterly forecast values of real disposable cash income and real cash income[2] obtained from time series models of respective indexes computed by Rosstat for the period from January 1999 to September 2021, as well as from Q1 2014 to Q3 2021. The above indexes depend to a certain extent on centralized decisions on raising wages and salaries to public sector workers, as well as on raising pensions, scholarships, and allowances; this introduces some change in the dynamics of the indexes under review. Consequently, future values of the indexes of real wages and real disposable cash income that are either considerably higher or lower than the previous ones due to such decisions may differ greatly from those which are implemented in reality.

The results presented in *Table 11*, project increase in real wages. The average monthly growth in real wages is expected at 4.5% compared to the same period of the previous year. At the year-end 2021, projected growth in real wages will come to 2.9%.

Table 10

Forecasts of the USD/RUB and EUR/USD exchange rates

Month	The USD/RUB exchange rate (RUB per USD)		The EUR/USD exchange rate (USD per EUR)	
	ARIMA	SM	ARIMA	SM
Dec 21	74,82	74,86	1,13	1,13
Jan 22	75,48	75,58	1,13	1,14
Feb 22	75,34	75,65	1,13	1,14
Mar 22	75,88	76,11	1,13	1,15
Apr 22	75,93	76,20	1,13	1,15
May 22	76,33	76,55	1,13	1,15
For reference: actual values in the similar period of 2020–2021				
Dec 20	73,88		1,23	
Jan 21	76,25		1,22	
Feb 21	74,44		1,20	
Mar 21	75,70		1,18	
Apr 21	74,38		1,21	
May 21	73,59		1,22	

Note. Over the respective periods, the series under review were identified as integrated series of the first order with a seasonal component.

Table 11

Forecast of real wages

Month	Real accrued wages
Forecast values according to ARIMA-models (as % to the respective month of 2020–2021)	
Dec 21	103,5
Jan 22	103,9
Feb 22	104,3
Mar 22	104,7
Apr 22	105,0
May 22	105,3
For reference: actual values in the respective period of 2020–2021 (as % to the same period of 2019–2020)	
Dec 20	104,6
Jan 21	100,1
Feb 21	102,0
Mar 21	101,8
Apr 21	107,8
May 21	103,3

Note. For calculation purposes real wages in base form were used (January 1999 was adopted as a base period). Over the period from January 1999 to September 2021 those series were attributed to the class of processes, which are stationary in differences and have an explicit seasonal component.

---

[1] The Bulletin uses the IMF data related to Euro/USD exchange rate for the period from January 1999 to August 2021, and on USD/RUB exchange rate from October 1998 to October 2021. Data for November 2021 were taken from the exchange rate website www.oanda.com.

[2] *Real cash income* – a relative index which is calculated by means of division of the index of nominal size (i.e. which was formed in the period under review) of cash income of the population by the CPI. *The real disposable cash income* – is cash income less mandatory payments and contributions. (See: *Rossiisky Statistichesky Ezhegodnik, Moscow, Rosstat, 2004, p. 212*).

The results presented in *Table 12* project growth in real disposable cash income by around 0.7%. At the same time, real cash income is projected to grow on average by 2.2% compared to the corresponding last year level. At the end of 2021, the projected gain in real disposable cash income will come to 2.7% and real cash income will grow by 3.9% over 12 months.

EMPLOYMENT AND UNEMPLOYMENT

Table 12
Forecasts of living standard indexes

Period	Real disposable cash income	Real cash income
Forecast values according to ARIMA-models (as % to the corresponding quarter of 2019/2020)		
Q4 2021	102,1	103,2
Q12022	99,2	101,2
For reference: actual values for the respective period of 2020 (in % to the same period of 2019)		
Q4 2020	98,8	99,0
Q1 2021	96,3	96,5

For the purpose of estimating future values of employment (the number of the gainfully employed population) and unemployment (the total number of the unemployed), models of time series, evaluated over the period from October 1998 to September 2021 from monthly data released by Rosstat,[1] were used. Unemployment was also estimated from models with results from responses to business surveys.[2]

Potential logical inconsistencies[3] in forecasts of employment and unemployment, for which totals should be equal to the index of the gainfully employed population, may arise due to the fact that each series is forecast individually and not as a difference between the forecast values of gainfully employed population and another index.

Table 13
Calculation of forecast values of employment and unemployment indexes

Month	Employment (ARIMA)		Unemployment (ARIMA)			Unemployment (BS)		
	Million people	Growth on the respective month of previous year (%)	Million people	Growth on the respective month of previous year (%)	% of the index of the number of the gainfully employed population	Million people	Growth on the respective month of previous year (%)	% of the index of the number of the gainfully employed population
Dec 21	72,3	2,1	3,3	-25,6	4,5	3,3	-25,2	4,6
Jan 22	71,7	1,4	3,3	-23,6	4,6	3,3	-23,5	4,6
Feb 22	71,7	1,3	3,2	-22,8	4,5	3,3	-22,3	4,6
Mar 22	71,9	1,3	3,2	-21,5	4,5	3,2	-21,0	4,5
Apr 22	71,8	0,9	3,2	-18,5	4,4	3,3	-16,3	4,6
May 22	72,0	0,5	3,1	-15,8	4,3	3,2	-14,5	4,4
For reference: actual values in the same periods of 2020–2021 (million people)								
Dec 20	70,8		4,4					
Jan 21	70,7		4,3					
Feb 21	70,8		4,2					
Mar 21	71,0		4,1					
Apr 21	71,2		3,9					
May 21	71,6		3,7					

Note. Over the period from October 1998 to September 2021, the unemployment series is a stochastic process, which is stationary around the trend. The unemployment series is a stochastic process with first order integration. Both indexes include a seasonal component.

According to ARIMA-model forecast (*Table 13*), in December 2021 – May 2022, the increase in the number of employed in the economy will average 1.3% per month against the corresponding period of the previous year. At 2021-end, the projected number of employed in the economy will come to 72.3 mn.

The average monthly decline in the total number of unemployed is forecast at 20.8% per month against the same period of last year. The average number of unemployed at the end of 2021 is forecast at 3.2 mn.

---

[1] The index is computed in accord with the methods of the International Labor Organization (ILO) and is given as of the month-end.
[2] The model is evaluated over the period from January 1999 to September 2021.
[3] For example, deemed as such a difference may be a simultaneous decrease both in employment and unemployment. However, it is to be noted that in principle such a situation is possible provided that there is a simultaneous decrease in the number of the gainfully employed population.
