The consumer price index stood at 0.6% in January 2014 (1.0% in January 2013), rising 0.1 p.p. above the value recorded in December 2013. Inflation reached 6.1% at the end of 12 months. The consumer price index stood at 0.5% within the first 17 days in February 2014. Net capital outflow from the country reached $16.6bn in Q4 2013 to a total of $64.7bn, reaching a total of $64.7bn within 12 months.

In January 2014, inflation in the Russian Federation remained at a high level: the consumer price index stood at 0.6% at the month’s end (as compared to 0.5% in December 2013), by 0.4 p.p. below the level recorded in 2013. As a result, inflation reached 6.1% on an annualized basis (Fig. 1). Core inflation stood at 0.4% in January 2014, by 0.1 p.p. lower than the level recorded in 2013.

Prices of food products increased 1.0% in January 2014 against December 2013 (Fig. 2). Prices of the following food products slowed down: butter (from 2.3% in December 2013 to 1.3% in January 2014), milk and dairy products (from 1.6% in December 2013 to 1.1% in January 2014), fish and seafood (from 1.5% in December 2013 to 0.8% in January 2014). Prices of the following food products kept falling: eggs (-6% in January 2014 against -0.6% in December 2013), cereal and bean products (-0.3% December 2013 and January 2014), granulated sugar (-0.8% against -1.4% in December 2013), sunflower oil (-0.7% against -1.1% in December 2013), red meat and poultry (-0.1% in December 2013 and in January 2014). Prices of the following food products saw increased growth rates: fruits and vegetable products (from 2.8% in December 2013 to 5.8% in January 2014), alcoholic beverages (from 0.4% in December 2013 to 1.6% in January 2014), personal services (from 0.5% in December 2013 to 0.7% in January 2014), insurance services (from 0.3% in December 2013 to 1.0% in January 2014), education services (from 0.0% in December 2013 to 0.2% in January 2014). Prices of the following services slowed down: passenger transport services (from 3.4% in December 2013 to 0.1% in January 2014).

In January 2014, growth rate of prices of non-food products increased 0.1 p.p. against December 2013 and stood at 0.3%. Prices of the following non-food products increased most: tobacco products by 0.8%, the same growth rate was recorded in December 2013; washing and cleaning products by 0.7%.

---

1 The reference consumer price index is an indicator which describes the level of inflation in the consumer market, net of seasonal factors (prices of fruit and vegetable products) and administrative factors (tariffs of regulated types of service, etc.). The index is also calculated by the Federal State Statistic Service of Russia (Rosstat).
(+0.4% in December 2013), consumer electronics and other household appliances by 0.5% (+0.3% in December 2013), audio-video appliances by 0.4% (+0.2% in December 2013). Prices of the following non-food products slowed down: clothing and underwear by 0.2% (+0.4% in December 2013), knitwear by 0.3% (+0.5% in December 2013), footwear by 0.1% (+0.2% in December 2013). Prices of motor gasoline increased 0.2% (-0.5% in December 2013). The interest rate on ruble overnight interbank loans.

In February 2014, inflation kept growing basically through growth in the price of fruits and vegetables and dairy products. Note that weakening of the ruble made a certain contribution in pushing up inflation, factoring in a big share of imported goods in the consumption of economic agents in the Russian Federation. The already happened devaluation of the ruble may accelerate inflation by 0.3–0.5 p.p. in the short run. Furthermore, if the ruble keeps weakening within a horizon of 6–12 months, the effect of the ruble exchange rate on prices may reach 50%, i.e. price growth may accelerate at half a rate the ruble weakens against the US dollar. Within 24 days in February 2014 the consumer price index stood at 0.7% (0.5% in the corresponding period of 2013). Lack of pronounced demand-driven pressure on prices as well as improved situation in the global agricultural market is the key factor constraining inflation.

In January 2014, the monetary base (broad definition) contracted 11% to Rb 9351,2bn (Fig. 3). The following components of the monetary base (broad definition) saw a decline: banks’ correspondent accounts (a decline of 10.1% to Rb 1142bn against December 2013), bank deposits (a decline of 75.7% to Rb 126bn), the volume of cash in circulation, including cash on hand at credit institutions slid down by 7.6% to Rb 7672bn. The volume of obligatory reserves increased 0.6% to reach Rb 411,3bn.

In January 2014, the monetary base (narrow definition) (cash plus obligatory reserves) contracted 7.3% to reach Rb 8083,4bn (Fig. 4).

In January 2014, volume of excessive reserves at commercial banks1 shrank 29.1% to Rb 1268bn while bank’s debt on repo transactions was reduced 5.5% to Rb 2,7 trillion. According to the data on February 25, 2014, banks’ debt on repo transactions was reduced to Rb 2,3 trillion. The interest rate in the interbank lending market2 was maintained at an average of 6.1% in January 2014 (6.4% in December 2013), 13%

---

1 Commercial banks’ excess reserves with the Central Bank are referred to the amount of commercial banks’ correspondent accounts, their deposits with the Central Bank, as well as Central Bank bonds held by commercial banks.
2 Interbank interest rate is the monthly average MIACR, an interest rate on ruble overnight interbank loans.
the regulator held such auction for the first time. The amount of allocated funds totaled Rb 500bn at 5.76% p.a.. During a similar auction which was held by the Bank of Russia on February 10, 2014 the hurdle rate stood at 5.85% while the allocated amount totaled Rb 200bn. It should be noted that it is only large banks with a distinctly bigger collateral base that can afford such actions despite fairly easy terms of lending at a floating interest rate.

The Central Bank’s international reserves totaled $498,9bn as of February 1, 2014, showing a 2.1% contraction since the beginning of the year (Fig. 4). At the same time, the monetary gold reserves increased $1,7bn in January 2014 after a positive revaluation of assets. In general, the contraction of the international reserves in January 2014 was basically caused by the regulator’s foreign currency interventions.

Bank of Russia’s foreign currency interventions through selling foreign exchange amounted to $7817m and 586m euro by the end of January 2014, making a record since the fall of 2011, when the amount of foreign exchange sold by the regulator in the domestic market reached $1,17bn (Fig. 6). Factoring in a substantial amount of foreign exchange interventions, the Bank of Russia’s measures are aimed at not only flattening volatility of the ruble exchange rate, but also maintaining it amid ongoing weakening of national currencies in developing countries. In January 2014, the regulator conducted no operations to purchase foreign currencies in connection with the Federal Treasury replenishing or spending foreign currency resources of sovereign funds. The 14-time 5-kopek extension of the borders of the dual-currency trading band in January 2014 pushed them to a level of Rb 34,25–41,25. In the period of February 1 thru 24, 2014, the dual-currency trading band was kept with a range of Rb 35,05–42,05. In the period of February 1 thru 24, 2014, Bank of Russia’s foreign currency sales volumes amounted to $5086m, and foreign currency interventions associated with the Federal Treasury replenishing or spending foreign currency resources of sovereign funds totaled $295m. Steady weakening of the ruble exchange rate, in our opinion, raises economic agents’ devaluation expectations, thereby weakening further the ruble exchange rate and spending the Central Bank of Russia’s reserves. In our opinion, drastic devaluation of the ruble exchange rate with its subsequent stabilization at a level reached would be a better policy.

According to the Bank of Russia’s preliminary estimates, net capital outflow from the country reached $16,6bn in Q4 2013, making a total of $64,7bn within 12 months, by $10,1bn more than the amount record-

In January 2014, the real effective ruble exchange rate vs. foreign currencies weakened by 1% (-1.1% in December 2013). As a reminder, the real effective ruble exchange rate lost 2% in 2013 in general (Fig. 7).

In January 2014, the ruble-to-dollar exchange rate dropped from 7.9% to Rb 35,2. The ruble weakened against euro by 6.7% (Rb 48,1) while the euro-to-dollar exchange rate averaged 1.36 during the same month. The value of the dual currency basket dropped 7.3% to Rb 41,0 in January 2014. Within 26 days in February 2014 the ruble-to-dollar exchange rate dropped 1.1% to reach Rb 35,6 per US dollar while the euro-to-ruble exchange rate fell 2.6% to reach Rb 48,9 per euro, so the value of the dual currency basket lost 1.9% to Rb 41,6. The euro-to-dollar exchange rate was 1.36 in February 2014. The ruble lost vs. the US dollar basically because of a trend towards decline in the current account balance and capital fleeing the country. Note that the Euro strengthened in response to the Euro-zone recovering from recession.

The Bank of Russia Board of Directors made a decision on January 13, 2014 to cut the volume of targeted
Interventions from $60m to 0 daily. This measure of the Central Bank of Russia is aimed at further enhancing flexibility of the exchange rate formation mechanism, creating conditions so that economic agents can gradually adapt to fluctuations of the exchange rate and master currency risk management instruments.

On February 3, 2014, the regulator introduced “fine tuning” operations on liquidity provision due to the abolishment of daily repo overnight auctions. The intensity of using “fine tuning” operations by the Bank of Russia is planned to be reduced to 2–3 times monthly as the banking system adapts to the use of the key instruments of liquidity provision and absorption of the Central Bank of Russia for longer periods (from 1 week to 1 year).

On February 17, 2014, the Bank of Russia supplemented its monetary policy system with “fine tuning” operations aimed at absorbing liquidity. Such operations will be conducted as 1-6-day deposit auctions at a maximum rate equal to the key rate (5.5%).

According to the Bank of Russia, “fine tuning” deposit operations are aimed at absorbing excessive liquidity in the banking sector at moments when the supply of liquid assets outstrips largely the demand due to autonomous factors. The introduction of “fine tuning” instruments will allow liquid assets to be managed more efficiently, which will eventually create preconditions for flattening interest rates volatility in the interbank lending market.
