### OUTLINE

- EXCHANGE RATE POLICY OF THE BANK OF RUSSIA: A BRIEF HISTORY
- CENTRAL BANKS' EXPERIENCE OF PURSUING EXCHANGE RATE POLICY
- METHODOLOGICAL ASPECTS OF EXCHANGE RATE CLASSIFICATION
- "FEAR OF APPRECIATION": GLOBAL EXPERIENCE
- EXCHANGE RATE POLICY IN RUSSIA: "FEAR OF APPRECIATION"
- CONCLUSIONS

### **EVOLUTION OF THE EXCHANGE RATE POLICY OF THE BANK OF RUSSIA**

- from 1999 to summer 2008 de-jure managed floating exchange rate, in fact volatility of the nominal exchange rate was limited to 2%;
- from 2008 to 2014 the Bank of Russia increased the flexibility of exchange rate policy by decreasing the volume of the central bank's intervention
- 10<sup>th</sup> November 2014 the Bank of Russia stopped interventions in order to limit exchange rate volatility while retaining the right to conduct them to support financial stability;
- from February to May 2015 the Bank of Russia didn't carry out interventions;
- May 2015 the Bank of Russia announced the intervention rule and renewed interventions;
- July 2015 The Bank of Russia stopped interventions, it has used only indirect measures to regulate the supply of foreign currency such as refinancing operations in foreign currency (currency refinancing). Exchange rate of ruble has been classified as free floating exchange rate.

### METHODOLOGICAL ASPECTS OF EXCHANGE RATE CLASSIFICATION

### **IMF, 2008**

Independently floating exchange rate is market determined, with any official foreign exchange market intervention aimed at moderating the rate of change and preventing undue fluctuations in the exchange rate, rather than establishing a level for it.

### **IMF, 2009**

A floating exchange rate is largely market determined, without an ascertainable or predictable path for the rate. In particular, an exchange rate that satisfies the statistical criteria for a stabilized or a crawl-like arrangement will be classified as such unless it is clear that the stability of the exchange rate is not the result of official actions. Foreign exchange market intervention may be either direct or indirect, and such intervention serves to moderate the rate of change and prevent undue fluctuations in the exchange rate, but policies targeting a specific level of the exchange rate are incompatible with floating. Floating arrangements may exhibit more or less exchange rate volatility, depending on the size of the shocks affecting the economy.

A floating exchange rate can be classified as *free floating* if intervention occurs only exceptionally and aims to address disorderly market conditions and if the authorities have provided information or data confirming that intervention has been limited to at most three instances in the previous six months, each lasting no more than three business days. If the information or data required are not available to the IMF staff, the arrangement will be classified as floating.

## V. Pontines, R.S. Rajan «Foreign exchange intervention and reserve accumulation in emerging Asia: is there evidence of fear of appreciation?» Economic Letters, 2011

$$L_t = \frac{1}{2} (R_t - R^*)^2 + \frac{\lambda}{2} \{ (\tilde{e}_t - e^*)^2 + \frac{y}{3} (\tilde{e}_t - e^*)^3 \}$$
 (1)

Rt –percent changes in foreign exchange reserves;

R\* is the optimal level of reserves;

 $\lambda$  is the relative weight ( $\lambda$ >0);

 $\tilde{e}_t$  is the percent change in the exchange rate;

e<sub>t</sub> is the foreign currency price of one unit of domestic currency and the NEER, respectively;

e\* is the Central Bank's exchange rate target;

y is the asymmetric preference parameter on exchange rate stabilization

$$R_t = R^* - \lambda a_1 E_{t-1} \left\{ \tilde{e}_t + \frac{y}{2} (\tilde{e}_t)^2 \right\} - \text{central bank's intervention function}$$
 (2)

$$R_t = c + a\tilde{e}_t + \beta(\tilde{e}_t)^2 + v_t, \quad a=-a_1 \lambda_1, \beta = -\lambda a_1 \frac{y}{2}$$
(3)

 $Y = \frac{2\beta}{\alpha}$  - is the asymmetric preference parameter on exchange rate stabilization

### CONCLUSIONS

- 1. The exchange rate policy in developing countries remains the significant part of monetary policy after their transition to inflation targeting. Even in those countries that adhere to a freely floating exchange rate (Chile, Mexico, Poland), the monetary authorities renew currency interventions if the increasing volatility of the exchange rate threatens financial stability. Within the floating exchange rate framework the central banks' interventions are not aimed at maintaining any level of the exchange rate;
- 2. Foreign exchange interventions are conducted in compliance with the rule which describes the purpose, terms and conditions of currency transactions, solely for the purpose of easing exchange rate volatility and / or increasing foreign exchange reserves;
- 3. Foreign exchange interventions in inflation targeting countries are conducted in the pre-crisis period in order to limit the pace of national currency appreciation. The calculations have confirmed the inherent "fear of appreciation" for the nominal exchange rate during this period, while the appreciation of the nominal effective exchange rate did not stop the regulator.
- 4. Before the crisis the Bank of Russia, adhering to the de-jure managed floating exchange rate, conducted active currency interventions. The obtained results show that the Bank of Russia experienced the "fear of appreciation" for the nominal exchange rate during 2000-2007, but after the crisis the presence of the "fear of appreciation" has not been confirmed.
