#### INTRODUCTION TO ALL THE ISSUES

This paper presents calculations of various economic indicators for the Russian Federation in *November* 2019 to *April* 2020<sup>1</sup>, which were performed using time series models developed as a result of research conducted by the Gaidar Institute over the past few years.<sup>2</sup> A method of forecasting falls within the group of *formal* or *statistical* methods. In other words, the calculated values neither express the *opinion* nor *expert evaluation* of the researcher, rather they are calculations of future values for a specific economic indicator, which were performed using formal ARIMA models (p, d, q) given a prevailing trend and its, in some cases, significant changes. The presented forecasts are of inertial nature, because respective models rely upon the dynamics of the data registered prior to the moment of forecasting and depend too heavily on the trends, which are typical of the time series in the period immediately preceding the time horizon to be forecast. The foregoing calculations of future values of economic indicators for the Russian Federation can be used in making decisions on economic policy, provided that the general trends, which were seen prior to forecasting for each specific indicator, remain the same, i.e. prevailing long-term trends will see no serious shocks or changes in the future.

Despite that there is a great deal of data available on the period preceding the crisis of 1998, models of forecasting were analyzed and constructed using only the time horizon which followed August 1998. This can be explained by the findings of previous studies<sup>3</sup>, which concluded, among other key inferences, that the quality of forecasts was deteriorated in most of the cases when the data on the pre-crisis period was used. Additionally, it currently seems incorrect to use even shorter series (following the crisis of 2008), because statistical characteristics of models based on such a short time horizon are very poor.

Models for the economic indicators in question were evaluated using standard methods of time series analysis. Initially, the correlograms of the studied series and their first differences were analyzed in order to determine the maximum number of delayed values to be included into the specifications of a model. Then, the results of analyzed correlograms served as the basis for testing all the series for weak stationarity (or stationarity around the trend) using the Dickey–Fuller test. In some cases, the series were tested for stationarity around the segmented trend using Perron and Zivot–Andrews tests for endogenous structural changes.<sup>4</sup>

The series were broken down into weak stationary, stationary near the trend, stationary near the trend with structural change or difference stationary, and then models, which corresponded to each type (regarding the levels and including, if necessary, the trend or segmented trend or differences), were evaluated. The Akaike and Schwartz information criteria, the properties of models' residuals (lack of autocorrelation, homoscedasticity and normality) and the quality of the in-sample-forecasts based on these models were used to choose the best model. Forecast values were calculated for the best of the models constructed for each economic indicator.

Additionally, the Bulletin presents future monthly values of the CPI, which were calculated using models developed at the Gaidar Institute, and volumes of imports/exports from/to all countries, which were calculated using structural models (SM). The forecast values based on the structural models may, in some cases, produce better results than ARIMA-models do, because structural models are constructed by adding information of the dynamics of exogenous variables. Besides, the use of structural forecasts in making aggregated forecasts (i.e. forecasts obtained as average value from several models) may help make forecast values more accurate.

<sup>&</sup>lt;sup>1</sup> Given that from early 2019 Rosstat does not release monthly data on indexes of real disposable cash income of the population, commencing from issue 8/2019 we release forecasts in quarter terms for 2 quarters ahead.

#### INDUSTRIAL PRODUCTION AND RETAIL SALES

The dynamics of the Consumer Price Index was modeled using theoretical assumptions arising from the monetary theory. The following was used as explanatory variables: money supply, output volume, the dynamics of the ruble-dollar exchange rate, which reflects the dynamics of alternative cost of money-keeping. The model for the Consumer Price Index also included the price index in the electric power industry, because the dynamics of manufacturers' costs relies heavily on this indicator.

The baseline indicator to be noted is the real exchange rate, which can influence the value of exports and imports, and its fluctuations can result in changes to the relative value of domestically-produced and imported goods, though the influence of this indicator turns out to be insignificant in econometric models. Global prices of exported resources, particularly crude oil prices, are most significant factors, which determine the dynamics of exports: a higher price leads to greater exports of goods. The level of personal income in the economy (labor costs) was used to describe the relative competitive power of Russian goods. Fictitious variables D12 and D01 – equal to one in December and January and zero in other periods – were added so that seasonal fluctuations were factored in. The dynamics of imports is effected by personal and corporate incomes whose increase triggers higher demand for all goods including imported ones. The real disposable cash income reflects the personal income; the Industrial Production Index reflects the corporate income.

The forecast values of foreign exchange rates were also calculated using structural models of their dependence on global crude oil prices.

The forecast values of explanatory variables, which are required for forecasting on the basis of structural models, were calculated using ARIMA models (p, d, q).

The paper also presents calculations of the values of the Industrial Production Index, the Producer Price Index and the Total Unemployment Index, which were calculated using the results of business surveys conducted by the Gaidar Institute. Empirical studies show<sup>1</sup> that the use of series of business surveys as explanatory variables <sup>2</sup> in forecasting models can make forecasting more accurate on the average. Future values of these indicators were calculated using ADL-models (seasonal autoregressive delays were added).

The Consumer Price Index and the Producer Price Index are also forecast using large datasets (factor models – FM). The construction of factor models relies basically on the evaluation of the principal components of a large dataset of socio-economic indicators (112 indicators in this case). The lags of these principal components and the lags of the explanatory variable are used as explanatory variables in these models. A quality analysis of the forecasts obtained for different configurations of the factor models was used to choose a model for the CPI, which included 9<sup>th</sup>, 12<sup>th</sup> and 13<sup>th</sup> lags of the four principal components, as well as 1<sup>st</sup> and 12<sup>th</sup> lags of the variable itself, and a model for the PPI, which included 8<sup>th</sup>, 9<sup>th</sup> and 12<sup>th</sup> lags of the variable itself.

All calculations were performed using the Eviews econometric package.

#### INDUSTRIAL PRODUCTION AND RETAIL SALES

#### Industrial production

For making forecast for November 2019 to April 2020, the series of monthly data of the indexes of industrial production released by the Federal State Statistics Service (Rosstat) from January 2002 to August 2019, as well as the series of the base indexes of industrial production released by the National Research University Higher School of Economics (NRU HSE<sup>3</sup>) over the period from January 2010 to September 2019 were used (the corrected value of January 2010 was equal to 100%). The forecast values of the series were calculated on the basis of ARIMA-class models. The forecast values of the Rosstat and the NRU HSE indexes of industrial production are calculated using business surveys (BS) as well. The obtained results are shown in Table 1.

0/2019

<sup>&</sup>lt;sup>1</sup> See, for example: V. Nosko, A. Buzaev, P. Kadochnikov, S. Ponomarenko. *The Analysis of Forecasting Parameters of Structural Models and Models with Business Surveys' Findings*. Moscow, IEP, 2003.

<sup>&</sup>lt;sup>2</sup> Used as explanatory variables were the following series of the business surveys: the current/expected change in production, the expected changes in the solvent demand, the current/expected price changes and the expected change in employment.

<sup>&</sup>lt;sup>3</sup> The indexes in question are calculated by E.A. Baranov and V.A. Bessonov.

as well as the NRU HSE chain IIP for mining and Rosstat chain IIP for machinery and equipment are identified as stationary processes around the trend with two endogenous structural changes. The time series of other chain indexes are stationary at levels. <sup>1</sup> It is to be noted that for making of forecasts so-called "raw" indexes (without seasonal and calendar adjustment) were used and for that reason in most models existence of the season factor is taken into account and, as a consequence, the obtained outputs reflect the seasonal dynamics of the series.

MODEL CALCULATIONS OF SHORT-TERM FORECASTS...

As seen from *Table 1*, the Rosstat average<sup>1</sup> growth in the industrial production index in November 2019 – April 2020 compared to the same period of the previous year for the industry as a whole comes to 2.8%. For the NRU HSE, the industrial production index also comes to 2.8%. At year-end 2019, projected growth in industrial production index according to Rosstat will amount to 2.5%, and growth in the industrial production index of NRU HSE – 2.1%.

The average monthly gain in the Rosstat and the NRU HSE industrial production indexes for mining and quarrying amount to 2.0% and 1.9%, respectively in November 2019 – April 2020.

The average gain in the industrial production index in manufacturing industry according to Rosstat for November 2019 – April 2020 amounts to 1.9% compared to the same period of the previous year and the NRU HSE industrial production index in manufacturing industry comes to 1.4%. The average monthly increase in production of food products to average by 3.3% and 3.2% for the Rosstat and NRU HSE indexes, respectively. The production of coke and petroleum products is forecast to grow on average by 1.7% and 0.6% for the Rosstat and NRU HSE indexes, respectively. The average monthly change in the industrial production index for primary metals and fabricated metal products for November 2019 – April 2020 computed by Rosstat and the NRU HSE constitutes (-0.3%) and (-2.6%), respectively. Manufacturing of machinery and equipment is forecast to grow on average by (-5.1%) and (-4.4%) for the Rosstat and the NRU HSE indexes, respectively.

The average gain in the industrial production index for electricity, gas, and steam supply; for air conditioning computed by Rosstat for November 2019 – April 2020 constitutes 1.9% in comparison with the same period of the previous year; the same indicator for the NRU HSE industrial production index comes to 0.6% per month.

Increase in the Rosstat industrial production indexes will average 2.7% (by types of economic activity) in 2019, and the NRU HSE industrial production indexes – (-1.9%).

#### **Retail Sales**

*This section (Table 2) presents forecasts of monthly retail sales made on the basis of monthly Rosstat data over January 1999 – October 2019.* 

As seen from *Table 2*, the average forecast increment in retail sales turnover for November 2019 to April 2020 against the corresponding period of 2018–2019 amounts to around 4.6%. The average forecast growth in the real turnover for the period from November 2019 to April 2020 compared to the same period of 2018– 2019 constitutes 1.0%.

Year-on-year, the nominal retail sales turnover in 2019 will gain 4.8%, and the real one -2.1%.

#### FOREIGN TRADE INDEXES

Model calculations of forecast values of the export and export to countries outside the CIS and the import and import from countries outside the CIS were made on the basis of the models of time series and structural models evaluated on the basis of the monthly data over the period

#### Table 2

# 10/2019

#### FOREIGN TRADE INDEXES

from September 1998 to September 2019 on the basis of the data released by the Central Bank of Russia.<sup>1</sup> The results of calculations are presented in Table 3.

Export, import, export outside the CIS and import from the countries outside the CIS are forecast to grow on average at 6.7%, 7.2%, 9.3%, and 4.5%, respectively for November 2019 – April 2020 against the same period of 2018–2019. The average forecast trade balance volume with all countries for November 2019 – April 2020 will total \$104.7 bn, which corresponds to a decline by 5.9% in relation to the same period of 2018–2019.

#### **DYNAMICS OF PRICES**

#### The Consumer Price Index and Producer Price Index

This section presents calculations of forecast values of the consumer price index and producer price index (as regards both the industry in general and some types of its activities under the National Industry Classification Standard (NICS)) made on the basis of the time-series models evaluated on the basis of the data released by Rosstat over the period from January 1999 to September 2019.<sup>2</sup> Table 4 presents the results of model calculations of forecast values over November 2019 to April 2020 in accordance with ARIMA models, structural models (SM) and models computed with the help of business surveys (BS).

The forecast average monthly increment in the consumer price index in November 2019 to April 2020 will come to 0.4%. The producer price index for industrial goods for the same period is forecast to average 0.1% per month. Annual gain in consumer price index on two models will come to 3.3%. The same indicator for the producer price index is forecast at 1.6%.

The Rosstat producer price indexes OKVED recast to grow at average monthly rate for November 2019 – April 2020: for mining and quarrying (-0.7%), manufacturing (-0.2%), utilities (electricity, gas, and steam) 0.2%, food products 0.3%, textile and sewing industry 0.2%, wood products 0.4%, pulp and paper industry 0.1%, coke and refined petroleum 1.3%, for chemical industry (-0.6%), for basic metals and fabricated metal 0.5%, for machinery and equipment 0.7%, and for motor vehicles manufacture 0.4%.

The annual gain in the producer price indexes across types of economic activity will average (-1.4%). At yearend 2019, the maximum annual gain is projected in motor vehicles manufacture (4.7%), and the minimum one – in mining and quarrying (-8.7%).

#### Table 5

Apr 20	1.8

**Note.** The series of the cost of the monthly per capita minimum food basket over the period from January 2000 October 2019 are stationary in the first-order differences.

#### The Cost of the Monthly

0/2019

per Capita Minimum Food Basket

This section presents calculations of forecast values of the cost of the monthly per capita minimum food basket over November 2019 to April 2020. The forecasts were made on the basis of time series with use the Rosstat data over the period from January 2000 to October 2019. The results are presented in Table 5.

The data on the foreign trade turnover is calculated by the CBR in accordance with the methods for making of the balance of payment in prices of the exporter-country (FOB) in billion USD.

Structural models were evaluated in the period from October 1998.

As can be seen from *Table 5*, the minimum set of food products' cost is forecast to grow compared to the corresponding level of the previous year. Having said that, the minimum set of food products is forecast to average RUB 4,192.5. The minimum set of food products cost is forecast to grow on average at around 2.8% against the same period of the previous year. The annual gain in the minimum set of food products cost will amount to 3.2% in 2019

#### **Indexes of Freight Rates**

This section presents calculations of forecast values of freight tariff indexes on cargo carriage,<sup>1</sup> made on the basis of time-series models evaluated on the Rosstat data over the period from September 1998 to September 2019. Table 6 shows the results of model calculations of forecast values in November 2019 – April 2020. It should be noted that some of the indexes under review (for instance, the index of pipeline tariff) are adjustable ones and for that reason their behavior is hard to describe by means of the time-series models. As a result, the future values may differ greatly from the real ones in case of the centralized increase in tariffs in the period of forecasting or in case of absence of such an increase in the forecasting period, but with it taking place shortly before the beginning of that period.

According to the forecast for November 2019 – April 2020, the composite index of transport tariffs on freight carriage will be growing at an average monthly rate of 0.5% in the course of 6 months. Having said that, in October 2019 seasonal decline in the index in expected by 453 p.p. As a result, its annual growth will come to 1.3%. In April 2020, seasonal growth in the index is expected at 3.7 p.p.

The index of motor freight tariffs will be increasing during these six months at an average monthly rate of 0.1%. Its annual increment in 2019 is forecast at 1.9%.

The index of pipeline tariffs during coming six months will be growing at an average monthly rate of 1.2%. Its annual increase in 2019 will amount to 11.3%. In April 2020, seasonal growth in the index is expected at 5.3 p.p.

#### Table 6

Jan 20	99.9	101.4	97.9
Feb 20	99.8	101.3	95.8
Mar 20	99.7	101.1	93.7
Apr 20	103.3	100.9	95.5
For r	eference: actual 20	values in the sar )18–2019	ne period <mark>of</mark>
	(% of the	previous month)	
Nov 18	100.7	99.9	100.0
Dec 18	101.0	100.1	102.2
Jan 19	97.6	100.1	90.5
Feb 19	100.3	102.0	99.9
Mar 19	100.0	100.1	99.8
Apr 19	105.0	99.9	112.7

**Note.** Over the period from September 1998 to September 2019, the series of the freight tariff index were identified as stationary ones; the other series were identified as stationary ones over the period from November 1998 to September 2019, too; fictitious variables for taking into account particularly dramatic fluctuations were used in respect of all the series.

#### **World Prices of Natural Resources**

This section presents calculations of such average monthly values of Brent crude prices (US\$ per barrel), the aluminum prices (US\$ per ton), the gold prices (\$ per ounce), the copper prices (US\$ per ton), and the nickel prices (US\$ per ton) over November 2019 to April 2020 as were received on the basis of nonlinear models of time series evaluated on the basis of the IMF data over the period from January 1980 to August 2019.

<sup>&</sup>lt;sup>1</sup> The paper presents a review of the composite freight rate index on freight transport and the motor load freight rate index, as well as the pipeline rate index. The composite freight rate index is computed on the basis of the freight rate indexes by individual types of transport: rail, pipeline, shipping, domestic water-borne, and motor load freight and air service (for more detailed information, pls. refer, for instance, to: *Prices in Russia*. The Official Publication of Goskomstat of RF, 1998).

#### MODEL CALCULATIONS OF SHORT-TERM FORECASTS...

The crude oil price is forecast to average around \$53.1 per barrel, which is below its corresponding year-earlier indexes on average by 15.5%. The aluminum prices are forecast to average around \$1,697 per ton and their average forecast decline constitutes around 9.4% compared to the same level of last year. The gold price is forecast to average \$1,612 per ounce. The copper price is forecast to average \$5,562 per ton, and prices for nickel – around \$21,281 per ton. The average forecast price increase in gold constitutes around 26.0%, average decline in copper prices – around 11.5%, average gain in nickel prices – 77.0% against the corresponding level of last year.

At year-end 2019, the forecast growth in crude oil, gold, and nickel prices compared to late 2018 will come to 1.7%, 27.4%, and 96.2%, respectively. Projected decline in prices on aluminum and nickel constitute 7.0 and 7.5%.

#### **MONETARY INDEXES**

The future values of the monetary base (in the narrow definition: cash funds and the Fund of Mandatory Reserves (FMR) and M<sub>2</sub> monetary aggregate over the period from November 2019 to April 2020 were received on the basis of models of time-series of respective indexes calculated by the CBR<sup>1</sup> in the period from October 1998 to October 2019. Table 8 presents the results of calculations of forecast values and actual values of those indexes in the same period of previous year. It is to be noted that due to the fact that the monetary base is an instrument of the CBR policy, forecasts of the monetary base on the basis of time-series models are to a certain extent notional as the future value of that index is determined to a great extent by decisions of the CBR, rather than the inherent specifics of the series.

In November 2019 – April 2020, the monetary base will be growing at an average monthly rate of 0.4%. The annual gain in the monetary base in 2019 will come according to projections to 4.5%. In January 2020, seasonal adjustment of the monetary base is projected by 4.7%.

In the period under review,  $M_2$  monetary index will be growing at an average monthly rate of 0.5%. Annual increment of  $M_2$  index in 2019 is forecast at 8.6%. In January 2020, the projected seasonal growth in  $M_2$ monetary index will come to 2.5%.

Feb 19		-5.0		-2.9		
Mar 19		0.3		1.1		
Apr 19		-0.4		-0.2		

**Note.** Over the period from October 1998 to October 2019, the time series of monetary base were attributed to the class of series which are stationary in the first-order differences and have an explicit seasonal component and the time series of  $M_2$  monetary aggregate from October 1998 to October 2019 was identified as stationary series with explicit seasonal component.

The data on the specific month is given in accordance with the methods of the CBR as of the beginning of the following month.

#### INTERNATIONAL RESERVES

This section presents the outputs of the statistical estimation of such future values of the international reserves of the Russian Federation<sup>1</sup> as were received on the basis of evaluation of the model of time series of the gold and foreign exchange reserves on the basis of the data released by the CBR over the period from October 1998 to October of 2019. That index is forecast without taking into account a decrease in the amount of reserves due to foreign debt payment and for that reason the values of the volumes of the international reserves in the months where foreign debt payments are made may happen to be overestimated (or otherwise underestimated) as compared to the actual ones.

Subsequent to the forecast findings for November 2019 – April 2020, the international reserves will be growing at an average monthly rate of 0.4%. In 2019, the international reserves are forecast to increase by 14.4%.

#### FOREIGN EXCHANGE RATES

The model calculations of prospective values of the foreign exchange rates (RUB per USD and USD per euro) were made on the basis of assessment of the time series models (ARI-MA) and structural models (SM) of the relevant indicators released by the Central Bank of Russia as of the last date of each month over the periods from October 1998 to October 2019 and from February 1999 to October 2019,<sup>2</sup> respectively.

In November 2019 – April 2020, USD/RUB average exchange rate is forecast according to two models in the amount of RUB 65.32 per USD. Projected for late 2019 value of this index will average at RUB 66.09 per USD according to two models.

Projected Euro/USD exchange rate over the period under review will average USD 1.10per 1 euro. In late 2019, value of the index is forecast to average at USD 1.10 per 1 euro according to two models.

#### *Table 9* The forecast of the international reserves of the Russian Federation

**Note.** Over the respective periods, the series under review were identified as integrated series of the first order with a seasonal component.

#### THE LIVING STANDARD INDEXES

This section (Table 11) presents results of calculations of monthly forecast values of index of real wages, as well as quarterly forecast values of real disposable cash income and real cash income<sup>3</sup> as were obtained on the basis of models of time series of respective indexes computed by Rosstat and taken over the period from January 1999

The data on the volume of the gold and foreign exchange reserves is presented as of the first day of the following month.
The Bulletin uses the IMF data related to Euro/USD exchange rate for the period from January 1999 to August 2019, and on USD/RUB exchange rate from October 1998 to September 2019. Data on Euro/USD exchange rate for September- October 2019 and on USD/RUB exchange rate for October 2019 were taken from the exchange rate website www.oanda.com.

<sup>&</sup>lt;sup>3</sup> Real cash income – a relative index which is calculated by means of division of the index of nominal size (i.e. which was formed in the period under review) of cash income of the population by the CPI. The real disposable cash income – is cash income less mandatory payments and contributions. (See: Rossiisky Statistichesky Ezhegodnik, Moscow, Rosstat, 2004, p. 212).

#### MODEL CALCULATIONS OF SHORT-TERM FORECASTS...

to October 2019, as well as from Q1 2014 to Q3 2019. The above indexes depend to a certain extent on the centralized decisions on raising of wages and salaries to public sector workers, as well as those on raising of pensions, scholarships, and allowances; such a situation introduces some changes in the dynamics of the indexes under review. Consequently, the future values of the indexes of real wages and real disposable cash income calculated on the basis of the series which last observations are either considerably higher or lower than the previous ones due to such a raise may differ greatly from those which are implemented in reality.

The results presented in *Table 11*, project growth in real wages. The real wages are expected to grow on average at 3.7% compared to the same period of the previous year. At year-end 2019, projected increase in real wages will amount to 0.5% for 12 months

Results presented in *Table 12* project average quarterly decline in real disposable cash income by 1.4% and real cash income by 1.3% compared to the corresponding period of the last year.

At year-end 2019, projected decline in real disposable cash income will come to 1.4%; reduction in real cash income – by 0.4% over 12 months

#### EMPLOYMENT AND UNEMPLOYMENT

For the purpose of calculation of the future values of the employment (of the number the gainfully employed population) and the unemployment (the total number of

### *Table 11* The forecast of the real wages

	Real accrued wages					
Forecas (as % to	st values according to ARIMA-models the respective month of 2018–2019)					
Nov 19	102.7					
Dec 19	103.1					
Jan 20	103.5					
Feb 20	103.9					
Mar 20	104.3					
Apr 20	104.7					
For reference: actual values in the respective period of 2018–2019 (as % to the same period of 2017–2018 )						
Nov 18	104.2					
Dec 18	102.9					
Jan 19	101.1					
Feb 19	100.0					
Mar 19	102.3					
Apr 19	103.1					

**Note.** For calculation purposes, the series of real wages in base form were used (January 1999 was adopted as a base period). Over the period from January 1999 to October 2019 those series were attributed to the class of processes, which are stationary in differences and have an explicit seasonal component.

## *Table 12* The forecast of the living standard indexes

Period	Real disposable cash income	Real cash income						
Forecast values according to ARIMA-models (as % to the corresponding quarter of 2018)								
Q4 2019	98.6	98.7						
Q1 2020	Q1 2020 98.6							
For reference: actual values for the respective period of 2018 (in % to the same period of 2017)								
Q4 2018	98.0	99.5						
Q1 2019	97.5	98.6						

the unemployed), models of the time series evaluated over the period from October 1998 to August 2019 on the basis of the monthly data released by Rosstat<sup>1</sup> were used. The unemployment was calculated on the basis of the models with results of the findings from business surveys<sup>2</sup> too.

It is to be noted that feasible logical inconsistencies<sup>3</sup> in forecasts of employment and unemployment which totals should be equal to the index of economically active population may arise due to the fact that each series is forecast individually and not as a difference between the forecast values of the economically active population and another index.

According to ARIMA-model forecast (see-*Table 13*), in November 2019 – April 2020, the decrease in the number of employed in the economy will average 1.6% per month against the corresponding period of the previous year. At year-end 2019, the projected number of employed in the economy population will come to 71.3 mn persons.

<sup>&</sup>lt;sup>1</sup> The index is computed in accordance with the methods of the International Labor Organization (ILO) and is given as of the month-end.

<sup>&</sup>lt;sup>2</sup> The model is evaluated over the period from January 1999 to August 2019.

<sup>&</sup>lt;sup>3</sup> For example, deemed as such a difference may be a simultaneous decrease both in the employment and the unemployment. However, it is to be noted that in principle such a situation is possible provided that there is a simultaneous decrease in the number of the economically active population.

#### EMPLOYMENT AND UNEMPLOYMENT

The average decrease in the total number of unemployed is forecast at 3.6% per month against the same period of last year. Average number of jobless in late 2019 is forecast to hit 3.5 mn persons.

Table 13
