# INTRODUCTION TO ALL THE ISSUES

This Bulletin presents calculations of values of different economic indices of the Russian Federation in March-August of 2013 made on the basis on the time-series models developed as a result of research carried out by the IEP in the past few years<sup>1</sup>. The utilized method of forecasting belongs to the group of formal or statistical methods. In other words, the obtained values are not the expression of the opinion or expert evaluation of the researcher, but calculations of future values of the specific economic index made on the basis of formal models of ARIMA (p, d, q) time series with taking into account the existing trend and, in some cases, its significant changes. The presented forecasts are of inertial nature because the respective models take into account the dynamics of the data till the date of making of the forecast and, particularly, depend to a great extent on the trends which are typical of the time series in the period which is just before the time interval for which the forecast is made. The evaluations of the future values of the economic indices of the Russian Federation can be used for approval of decisions related to the economic policy provided that the general trends observed till the date on which the forecast is made in respect of each particular index do not change, that is, there will be no serious shocks or changes in the existing long-term trends.

Despite the fact that a large volume of the data related to the period prior to the 1998 crisis is available, the analysis and model building for forecasting were carried out in the period after August 1998. It was justified by outputs of the pervious research<sup>2</sup> whose main conclusion was the fact that with the pre-crisis period taken into account the quality of forecasts in most cases declines. On the other hand, now it seems incorrect to use ever shorter series (after the 2008 crisis), as statistical qualities of the models built on the basis of such a short period happen to be rather low.

The evaluation of the models of the economic indices was carried out on the basis of the standard methods of analysis of time series. At the first stage, correlograms of the researched series and their first differences were analyzed in order to determine the maximum number of the delayed values which need to be included into the specifications of the model. Then, on the basis if the outputs of the analysis of the correlograms all the series were tested for weak stationarity (or stationarity around the trend) by means of the Dickey–Fuller test. In some cases, testing of series for stationarity around the segmented trend by means of the Perron and Zivot–Andrews tests for endogenous structural changes³ was carried out.

Upon division of the series into those with weak stationary, trend stationary, segmented trend stationary or difference stationary, models corresponding to each of the above types were evaluated (as regards the levels and if necessary with inclusion of the trend, segmented trend or the differences). On the basis the Akaike and Schwartz information criteria and the parameters of the rest of the models (lack of autocorrelation, homoscedasticity and normality) and the quality of in-sample-forecasts obtained by means of those models, the best one was selected. Calculations of the forecast values were carried out on the basis of the best model which was built for each economic index.

# INTRODUCTION TO ALL THE ISSUES

In addition to the above, on the basis of the models developed by the IEP *the Bulletin* presents the calculations of future values of monthly indices of the CPI, the volume of the import from all the countries and the export to all the countries on the basis of structural models (SM). The forecast values obtained on the basis of structural models can in a number of cases produce better results as compared to ARIMA-models because in building of such models the additional information on the dynamics of exogenous variables is used. In addition to the above, inclusion of structural forecasts in building of aggregated forecasts (that is, forecasts obtained as an average value by a few models) may contribute to adjustment of forecast values.

In modeling the dynamics of the consumer price index, theoretical hypotheses resulting from the monetary theory were used. Utilized as explanatory variables were: the money supply, output volume and the dynamics of the nominal RUR/USD exchange rate which defines the dynamics of the alternative cost of money safe-keeping. Also, the model for the consumer price index included the index of prices on power because that index determined to a great extent the dynamics of manufacturers' costs.

It is to be noted that the main index which may have an effect on the value of the export and the import is the real exchange rate which fluctuations result in the change in the relative value of domestic and import goods. However, in the econometric models that effect is insignificant. The most important factors which determine the dynamics of the export are the global prices on the exported resources, particularly, oil prices: price rises result in growth in export of goods. Used as a parameter of relative competitiveness of Russian goods was the level of households' income in the economy (the cost of the work force). In order to take into account seasonal fluctuations of the export, fictitious variables D12 and D01 equal to one in December and January, respectively, and zero in the other periods were introduced. The dynamics of the import is influenced by the income of households and industries; growth in income results in growth in demand in all the goods, including imported ones. The parameter of the households' income is the real disposable cash income, while that of the income of industries is the index of industrial production.

The forecast values of currency exchange rates are also based on structural models of their dependence on international oil prices.

Forecast values of explanatory variables required for making of forecasts on the basis of structural models were calculated on the basis of ARIMA (p, d, q) models.

Also, the paper presents calculations of the values of the indices of industrial production, producer price index and the index of the total number of the unemployed calculated with use of the results of the business surveys (BS) carried out by the IEP. The empirical studies show¹ that utilization of the series of the business polls as explanatory variables² in prediction models improves on average the accuracy of the forecast. Calculations of future values of those indices were made on the basis of the ADL-model (with addition of seasonal autoregressive delays).

All the calculations were carried out with use of the Eviews econometric package.

<sup>1</sup> See, for example: V. Nosko, A. Buzaev, P. Kadochnikov, S. Ponomarenko. The Analysis of Forecasting Parameters of Structural Models and Models with Business Surveys Results. M., IEP, 2003.

<sup>2</sup> Used as explanatory variables were the following series of the business polls: the current/expected change in production, the expected changes in the solvent demand, the current/expected price changes and the expected change in employment.

Note: in the time spans under review, the series of the Rosstat and NRU HSE chain indices of industrial production as regards industry in general, as well as the NRU HSE chain indices of industrial production as regards manufacturing of machines and equipment are identified as stationary processes around the trend with an endogenous structural change; the series of the Rosstat and NRU HSE chain indices of industrial production as regards manufacturing industry, iron and steel industry and production of finished metal goods, as well as the NRU HSE chain indices of industrial production as regards production of primary products and Rosstat chain index as regards production of machines and equipment are identified as stationary processes around the trend with two endogenous structural changes. The time series of other chain indices are stationary at levels.

<sup>1</sup> It is to be noted that for making of forecasts so-called "raw" indices (without seasonal and calendar adjustment) were used and for that reason in most models existence of the season factor is taken into account and, as a consequence, the obtained outputs reflect the seasonal dynamics of the series.

#### INDUSTRIAL PRODUCTION AND RETAIL SALES

#### **Industrial production**

For building of the forecast for March–August 2013, the series of monthly data of the indices of industrial production of the Federal State Statistics Service (Rosstat) from January 2002 till December 2012, as well as the series of the base indices of industrial production of the Center for the Economic Situation under the National Research University Higher School of Economics (NRU HSE¹) in the period from January 1999 till January 2013 were used (the value of January 1995 was equal to 100%). The forecast values of the series were calculated on the basis of ARIMA-class models. The forecast values of the Rosstat and NRU HSE indices of industrial production are calculated with use of business surveys (BS) as well. The obtained outputs are shown in Table 1.

As seen from *Table 1*, the average<sup>2</sup> growth in the NRU HSE index of industrial production in March–August 2013 on the corresponding period of 2012 as regards industry in general amounts to 2.6%. As regards the Rosstat index of industrial production, it amounts to 1.9%.

In March–August 2013, the monthly average values of the Rosstat and NRU HSE indices of industrial production as regards production of primary products amount to 0% and 0.2%, respectively. As regards production of charred coal and oil products, the average growth in the indices of Rosstat and NRU HSE is expected at the level of 5.0% and 5.3%, respectively.

In March–August 2013, the average growth in the NRU HSE index of industrial production as regards manufacturing industry amounts to 4.0% on the corresponding period of 2012, while that in the Rosstat index, to 2.5%. The monthly average values of the Rosstat and NRU HSE indices of industrial production as regards production of food products amount to 3.7% and 4.9%, respectively. In March–August 2013, the monthly average values of the Rosstat and NRU HSE indices of industrial production as regards iron and steel industry and production of finished metal goods amount to 2.3% and 0.7%, respectively. As regards production of machines and equipment, the average growth in the indices of Rosstat and NRU HSE is expected at

the level of 7.9% and 6.0%, respectively.

In March–August 2013, the average growth in the Rosstat index of industrial production as regards production and distribution of power, gas and water amounts to 2.1% on the corresponding period of 2012, while that in the NRU HSE index, to 2.9%.

**Retail Sales** 

This section (Table 2) presents forecasts of monthly retail sales made on the basis of monthly Rosstat data in the January 1999 – December 2012 period.

As seen from *Table 2*, in March-August 2013 the average expected growth in monthly sales volumes amounts to about 13.0% on the corresponding period of 2012.

In spring-summer 2013, the average expected growth in monthly real sales amounts to 6.2% on the corresponding period of 2012.

*Note:* series of retail sales and real retail sales in the January 1999 – December 2012 period.

<sup>1</sup> The indices in question are calculated by E.A. Baranov and V.A. Bessonov.

<sup>2</sup> The average growth in the indices of industrial production means in this context the average value of such indices in the period of six months of the forecast.

#### Table 3

# **INVESTMENTS IN CAPITAL ASSETS**

Table 3 presents the outputs of calculations of forecast values of investments in capital assets in March-August 2013. The forecasts were made on the basis of time-series models with utilization of the Rosstat data of the January 1999 – December 2012 period.

The outputs in *Table 3* show that in March–August 2013 the average expected growth in investments amounts to about 9.5% on the corresponding period of 2012.

In March–August 2013, the average expected growth in real investments amounts to 4.9% on the corresponding period of 2012.

Note: series of investments in capital assets in the January 1999 – December 2012 period are series of DS type.

# **FOREIGN TRADE INDICES**

Model calculations of forecast values of the export and export to countries outside the CIS and the import and import from countries outside the CIS were made on the basis of the models of time series and structural models evaluated on the basis of the monthly data in the period from September 1998 till December 2012 on the basis of the data of the Central Bank of Russia<sup>1</sup>. The outputs of the calculations are shown in Table 4.

In March–August 2013, the average expected growth in the export, import, export to countries outside the CIS and import from countries outside the CIS will amount to 9.8%, 10.6%, 10.9 % and 6.0%, respectively on the corresponding period of 2012. In March–August 2013, the average expected volume of the trade balance with all the countries will amount to \$98.1bn which figure is equal to a 8.2% increase as compared to the same period of 2012.

*Note*: in the period from January 1999 till December 2012, the series of the export, import, export to the countries outside the CIS and import from the countries outside the CIS were identified as stationary series in the first-order differences. In all the cases, seasonal components were included in the specification of the models.

# **DYNAMICS OF PRICES**

#### The Consumer Price index and Producer Price Indices

This section presents calculations of forecast values of the consumer price index and producer price indices (as regards both the industry in general and some types of its activities under the National Industry Classification Standard (NICS)) made on the basis of the time-series models evaluated on the basis of the Rosstat data in the period from January 1999 to December 2012<sup>1</sup>. Table 5 presents the outputs of model calculations of forecast values in March–August 2013 in accordance with ARIMA-models, structural models (SM) and models built with utilization of business surveys (BS).

*Note*: in the period from January 1999 till December 2012, the series of the chain producer price index of industrial goods as regards production of machines and equipment are identified as a stationary process around the trend with two endogenous structural changes. The series of other chain price indices are stationary at levels.

In March–August 2013, the expected monthly average growth in the consumer price index will amount to 0.4%. In the above period, growth in prices of producers of industrial goods is expected to be on average at the level of 0.5% a month.

As regards NICS-producer price indices, in March–August 2013 the following monthly average growth rates are expected: production of primary products (2.2%), manufacturing (0.7%), production and distribution of power, gas and water (0.2%), production of food products (0.9%), textile and sewing industry (0.6%), woodworking and production of wood products (0.3%), pulp and paper industry (0.5%), production of charred coal and oil products (2.2%), chemical industry (0.5%), iron and steel industry and production of finished metal goods (1.5%), production of machines and equipment (0.2%) and production of transport vehicles and equipment (0.4%).

#### The dynamics of the cost of the minimum package of food products

This section presents the outputs of calculations of forecast values of the cost of the minimum package of food products in March–August 2013. The forecasts were made on the basis of time series with use the Rosstat data in the period from January 2000 till December 2012. The outputs of calculations are shown in Table 6.

As seen from *Table 6*, growth in the cost of the minimum package of food products as compared to the respective level of 2012 is expected. It is to be noted that the average expected cost of the minimum package of food products amounts to about Rb 2,739.8. The expected growth in the cost of the minimum package of food products amounts on average to about 7.3% as compared to the level of the same period of 2012.

Table 6
THE FORECAST OF THE COST OF THE MINIMUM PACKAGE OF FOOD PRODUCTS (PER PERSON A MONTH)

Forecast values according to ARIMA-model (Rb)										
March 2013	2692.9									
April 2013	2702.2									
May 2013	2720.1									
June 2013	2764.3									
July 2013	2793.0									
August 2013	2766.4									
For reference: actual values in the	same months of 2012 (billion Rb)									
March 2012	2472.8									
April 2012	2482.9									
May 2012	2508.5									
June 2012	2602.8									
July 2012	2658.4									
August 2012	2595.8									
Expected growth on the respective	ve month of the previous year (%)									
March 2013	8.9									
April 2013	8.8									
May 2013	8.4									
June 2013	6.2									
July 2013	5.1									
August 2013	6.6									

*Note*: the series of the cost of the minimum package of food products in the period from January 2000 till December 2012 are stationary in the first-order differences.

#### **Indices of Transportation Tariffs on Cargo Carriage**

This section presents calculations of forecast values of price indices of transportation tariffs on cargo carriage<sup>1</sup>, made on the basis of time-series models evaluated on the basis of the Rosstat data in the period from September 1998 till December 2012. Table 7 shows the outputs of model calculations of forecast values in March—August 2013. It is to be noted that some of the indices under review (for instance, the index of tariffs on pipeline transportation) are adjustable ones and for that reason their behavior is hard to describe by means of the time-series models. As a result, the future values may differ greatly from the real ones in case of the centralized increase of the tariffs in the period of forecasting or in case of absence of such an increase in the forecasting period, but with it taking place shortly before the beginning of that period.

Table 7
THE OUTPUTS OF CALCULATIONS OF FORECAST VALUES OF INDICES OF TRANSPORTATION TARIFFS

Period	Composite index of transportation tariffs on cargo carriage	Index of tariffs on motor cargo carriage	Index of tariffs on pipeline transportation
	Forecast values according to ARIM.	A-models (% of the previous m	nonth)
March 2013	100.4	100.0	104.3
April 2013	100.4	100.0	102.5
May 2013	100.4	100.0	100.0
June 2013	100.4	100.0	101.9
July 2013	100.4	100.0	104.0
August 2013	100.3	99.9	101.9

<sup>1</sup> The Bulletin presents a review of the composite index of transportation tariffs on cargo carriage and the index of transportation tariffs on motor cargo carriage, as well as the index of tariffs on pipeline transportation. The composite index of transportation tariffs on cargo carriage is calculated on the basis of the indices of tariffs on cargo carriage by individual types of transport: railway, pipeline, shipping, domestic water-borne, motor and air service (for more detailed information, pls. refer, for instance, to: Prices in Russia. The Official Publication of Goskomstat of RF, 1998).

Table 7

Period	Composite index of transportation tariffs on cargo carriage	Index of tariffs on motor cargo carriage	Index of tariffs on pipeline transportation					
	Forecast values according to ARIMA-mod	lels (% of December of the previous year)						
March 2013	100.0	100.6	100.0					
April 2013	105.2	100.4	111.6					
May 2013	100.2	100.4	100.1					
June 2013	100.2	100.5	100.1					
July 2013	105.8	99.9	112.4					
August 2013	100.2	100.3	100.3					
	For reference: actual values in the same	period of 2012 (% of the previo	ous month)					
March 2012	100.6	100.0	100.0					
April 2012	100.4	111.6	105.2					
May 2012	100.4	100.1	100.2					
June 2012	100.5	100.1	100.2					
July 2012	99.9	112.4	105.8					
August 2012	100.3	100.3	100.2					

*Note*: in the period from September 1998 till December 2012, the series of the index of tariffs on motor cargo carriage were identified as stationary ones; the other series were identified as stationary ones in the period from September 1998 till December 2012, too; fictitious variables for taking into account particularly dramatic fluctuations were used in respect of all the series.

On the basis of the results of the forecast for March–August 2013, the monthly average growth in the composite index of transportation tariffs on cargo carriage will be at the level of 0.4%.

It is expected that in spring–summer 2013 the index of tariffs on motor cargo carriage will not virtually change. In the next six months, the index of tariffs on pipeline transportation will grow at the monthly average rate of 2.5%.

#### The dynamics of prices on some types of primary products on the global market

This section presents calculations of such average monthly values of prices on Brent oil (\$ per barrel), Aluminum (\$ per ton), gold (\$ per ounce), copper (\$ per ton) and nickel (\$ per ton) in March—August of 2013 as were received on the basis of nonlinear models of time series evaluated on the basis of the IMF data in the period from January 1980 till January 2013.

Table 8
THE OUTPUTS OF CALCULATIONS OF FORECAST VALUES OF PRICES ON PRIMARY PRODUCTS

Month	Brent oil (\$ per barrel)	Aluminum (\$ per ton)	Gold (\$ per ounce)	Copper (\$ per ton)	Nickel (\$ per ton)
	For	ecast values accord	ing to ARIMA-mode	ls	
March 2013	119.41	2057	1684	8086	17179
April 2013	121.00	2052	1690	8065	17549

August 2013	127.84	2019	1704	7954	17824
	Growth or	n the respective mo	nth of the previous y	vear (%)	
March 2013	-4.4	-5.8	0.5	-4.5	-7.9
April 2013	0.3	0.2	2.5	-2.7	-1.9
May 2013	10.6	1.2	6.8	1.9	3.0
June 2013	29.4	7.9	6.3	8.1	6.3
July 2013	21.9	8.4	6.7	5.5	10.2
August 2013	12.8	9.5	4.8	5.9	13.5
	For refer	ence: actual values	in the same period	of 2012	
March 2012	124.93	2184	1675	8471	18661
April 2012	120.59	2049	1649	8286	17893
May 2012	110.52	2003	1585	7897	16968

Table 8

Month	Brent oil (\$ per barrel)	Aluminum (\$ per ton)	Gold (\$ per ounce)	Copper (\$ per ton)	Nickel (\$ per ton)
June 2012	95.59	1886	1596	7428	16604
July 2012	103.14	1876	1594	7584	16128
August 2012	113.34	1843	1626	7510	15704

*Note*: in the period from January 1980 till January 2013, the series of prices on oil, nickel, gold, copper and aluminum are series of DS type.

The average expected level of prices on oil amounts to about \$123.3 per barrel which figure is on average 11.8% higher than the respective indices of the previous year. Prices on aluminum are expected at the level of about \$2,037 per ton, while their average growth is expected to amount to about 4% against the respective level of the previous year. Prices on gold are expected to amount to about \$1,695 per ounce. Average prices on copper are expected to amount to about \$8,030 per ton, while those on nickel, to about \$17,577 per ton. The average expected growth in prices on gold, copper and nickel amounts to about 5%, 2% and 4%, respectively, on the respective level of the previous year.

# **MONETARY INDICES**

The future values of the monetary base (in the narrow definition: cash funds and the Fund of Mandatory Reserves (FMR)) and  $M_2$  monetary aggregate in March–August 2013 were received on the basis of models of time-series of respective indices calculated by the CBR<sup>1</sup> in the period from October 1998 till December 2012. Table 9 presents the outputs of calculations of forecast values and actual values of those indices in the same period of the previous year. It is to be noted that due to the fact that the monetary base is an instrument of the policy of the CBR the forecasts of the monetary base on the basis of time-series models are to a certain extent notional as the future value of that index is determined to a great extent by decisions of the CBR, rather than the inherent specifics of the series.

Table
THE FORECAST OF M<sub>3</sub> MONETARY AGGREGATE AND THE MONETARY BASE

2						
Period	Moneta	ry base	${ m M}_{_2}$			
	Billion Rb	Growth on the previous month, %	Billion Rb	Growth on the previous month, %		
March 2013	7533.3	1.2	28364.7	1.4		
April 2013	7634.8	1.3	28769.3	1.4		
May 2013	7727.1	1.2	29177.8	1.4		
June 2013	7828.6 1.3		29591.2	1.4		
July 2013	7925.3 1.2		30009.3	1.4		
August 2013	8027.9		30432.2	1.4		
For reference	ce: actual value in the re	spective months of 2012	2 (growth on the previou	s month, %)		
March 2012	-1	.4	0.8			
April 2012	2.	8	0.8			
May 2012	0.	5	0.8			
June 2012	2.	1	1.3			
July 2012	1.	0	-0.5			
August 2012	-0	.9	0.0			

*Note*: in the period from October 1998 to December 2012, all the time series of monetary indices were attributed to the class of series which are stationary in the first-order differences and have an explicit seasonal component.

<sup>1</sup> The data on the specific month is given in accordance with the methods of the CBR as of the beginning of the following month.

In March–August 2013, the expected monthly average rate of growth in the monetary base will amount to 1.3% a month. The  $\rm M_2$  monetary index will grow at the monthly average rate of 1.4% in the period under review.

# **INTERNATIONAL RESERVES**

Table 10
THE FORECAST OF INTERNATIONAL
(GOLD AND FOREIGN EXCHANGE) RESERVES

This section presents the outputs of the statistical evaluation of such future values of the international reserves of the Russian Federation<sup>1</sup> as were received on the basis of evaluation of the model of time series of the gold and foreign exchange reserves on the basis of the data of the CBR in the period from October 1998 till December 2012. That index is forecasted without taking into account a decrease in the amount of the reserves due to payment of the foreign debt and for that reason the values of the volumes of the international reserves in the months where foreign debt payments are made may happen to be overestimated (or, otherwise, underestimated) as compared to the actual ones.

Period	Forecast values according to ARIMA-models				
r eriou	Billion USD	Growth on the previous month, %			
March 2013	547.1	1.3			
April 2013	548.0	0.2			
May 2013	553.1	0.9			
June 2013	562.6	1.7			
July 2013	570.6	1.4			
August 2013	575.9	0.9			
For reference:	actual values in	the same period of 2012			
March 2012	513.5	-0.1			
April 2012	524.4	2.1			
May 2012	510.4	-2.7			
June 2012	514.3	0.8			
July 2012	510.5	-0.7			
August 2012	514.6	0.8			

On the basis of the outputs of the forecast, in March–August 2013 the international reserves will grow at the average monthly rate of 1.1%.

Note: in the period from October 1998 till December 2012, the series of the gold and foreign exchange reserves of the Russian Federation were identified as stationary series in difference.

Table 11

# **FOREIGN EXCHANGE RATES**

The model calculations of prospective values of the foreign exchange rates (RUR per USD and euro) were made on the basis of assessment of the time series models (ARIMA) and structural models (SM) of the relevant indicators quoted by the RF Central Bank as of the last date of each month over the periods between October 1998 and January 2013 and between January 1999 and January 2013<sup>2</sup>, respectively.

In the period under review, the value of the USD/RUR exchange rate is forecasted on the basis of the average of the two models equal to Rb 30.6 per \$1. A similar forecast of the EUR/USD exchange rate will amount to \$1.33 per euro.

FORECASTS OF THE RUR/USD AND USD/EUR EXCHANGE RATES

Period		UR/USD exchange rate ding to ARIMA-model	Forecast values of the USD/EUR (USD per EUR) according to ARIMA-model		
	ARIMA	SM	ARIMA	SM	
March 2013	30.58	30.48	1.33	1.32	
April 2013	30.54	30.71	1.33	1.32	

<sup>1</sup> The data on the volume of the gold and foreign exchange reserves is presented as of the first day of the following month

<sup>2</sup> The Bulletin applies the IMF's data for the period between January 1999 and November 2012. The data for December 2012 and January 2013 was obtained from the foreign exchange rate statistics website: www.oanda.com

Table 11

Period	Forecast values of the R (RUR per USD) accord	UR/USD exchange rate ding to ARIMA-model	Forecast values of the USD/EUR (USD per EUR) according to ARIMA-model		
	ARIMA	SM	ARIMA	SM	
May 2013	30.53	30.59	1.33	1.32	
June 2013	30.50	30.79	1.34	1.32	
July 2013	30.45	30.69	1.34	1.32	
August 2013	30.39 30.88		1.35		
	For referen	ce: actual values in the si	milar period of 2012		
March 2012	29.	33	1.3	34	
April 2012	29.	36	1.32		
May 2012	32.45		1.24		
June 2012	32.82		1.26		
July 2012	32.19		1.23		
August 2012	32.29		1.26		

*Note*: in the respective periods, the series under review were identified as integrated series of the first order with a seasonal component.

# INDICES OF THE STANDARD OF LIVING

This section (Table 12) presents such outputs of calculations of forecast values of indices of real wages, real disposable cash income and real cash income <sup>1</sup> as were received on the basis of the model of time series of respective indices calculated by Rosstat and taken in the period from January 1999 till January 2013. The above indices depend to a certain extent on the centralized decisions on raising of wages and salaries to public sector workers, as well as those on raising of pensions, scholarships and allowances; such a situation introduces some changes in the dynamics of the indices under review. As a result, the future values of the indices of real wages and real disposable cash income calculated on the basis of the series which last observations are either considerably higher or lower than the previous ones due to such a raising may differ greatly from those which are implemented in reality.

According to the outputs shown in *Table 12* growth in the indices of the standard of living of the population on the level of the respective period of the previous year is expected. So, the average growth of about 2.8% in real disposable cash income is expected; growth in real cash income on the respective level of the previous year is expected to amount to 2.5%. Growth in real wages and salaries is expected to amount to 6.5% on the corresponding period of the previous year.

THE FORECAST OF THE INDICES OF THE STANDARD OF LIVING

Table 12

Period	Real disposable cash income	Real cash income	Real accrued wages and salaries		
Forecast values according to ARIMA-models (% of the respective month of 2012)					
March 2013	105.5	105.5	108.6		
April 2013	102.6	102.1	105.0		
May 2013	104.8	103.8	104.0		
June 2013	101.2	101.4	105.2		
July 2013	102.6	101.0	106.9		
August 2013	100.2	101.0	109.1		

<sup>1</sup> Real cash income is a relative index which is calculated by means of division of the index of the nominal size (which was actually formed in the period under review) of households' cash income by the CPI. Real disposable cash income is cash income minus mandatory payments and contributions. (See: Rossiisky Statistichesky Ezhegodnik, Moscow, Rosstat, 2004, p. 212.).

Table 12

Period	Real disposable cash income	Real cash income	Real accrued wages and salaries			
Fo	For reference: actual values in the respective period of 2012 (% of the same period of 2011)					
March 2012	102.1	102.6	109.0			
April 2012	101.1	102.1	111.1			
May 2012	104.9	106.5	112.4			
June 2012	106.4	106.3	110.2			
July 2012	100.1	102.8	108.1			
August 2012	108.9	107.7	106.0			

*Note*: for calculating purposes, the series of the disposable cash income, real cash income and real wages in the base form were used (March 1999 was adopted as a base period). In the period from January 1999 till January 2013, those series were attributed to the class of processes which are stationary in differences and have an explicit seasonal component.

# EMPLOYMENT AND UNEMPLOYMENT

For the purpose of calculation of the future values of the employment (of the number the gainfully employed population) and the unemployment (the total number of the unemployed), models of time series evaluated in the period from October 1998 till November 2012 on the basis of the monthly data of Rosstat<sup>1</sup> were used. The unemployment was calculated on the basis of the models with results of the outputs of business polls<sup>2</sup>, too. It is to be noted that possible logical differences<sup>3</sup> in forecasts of the employment and the unemployment which totals should be equal to the index of the economically active population may arise due to the fact that each series is forecasted individually and not as the difference between the forecast values of the economically active population and another index.

Table 1.

THE OUTPUTS OF CALCULATION OF FORECAST VALUES OF THE INDICES THE EMPLOYMENT

AND THE UNEMPLOYMENT

AND THE UNEMPLOYMENT								
	Empl	loyment (ARIMA)	Unemployment (ARIMA)			Unemployment (BS)

June 2012		72.2	4.1					
July 2012		72.3	4.1					
August 2012		72.5	4.0					

*Note:* in the period from October 1998 till December 2012, the series of the number of the gainfully employed population is a stochastic process which is stationary around the trend. The series of the index of the total number of the unemployed is a stochastic process with the first order integration. Both the indices include a seasonal component.

<sup>1</sup> The index is calculated in accordance with the methods of the International Labor Organization (ILO) and is given as of the end of the month.

<sup>2</sup> The model is evaluated in the period from January 1999 till December 2012.

<sup>3</sup> For example, deemed as such a difference may be a simultaneous decrease both in the number of the gainfully employed population and the total number of the unemployed. However, it is to be noted that in principle such a situation is possible provided that there is a simultaneous decrease in the number of the economically active population.

#### EMPLOYMENT AND LINEMPLOYMENT

According to the forecasts on the basis of ARIMA-models (*Table 13*), in March-August 2013 growth in the number of gainfully employed population will amount on average to 1.0% a month on the corresponding period of 2012.

The average decrease in the index of the total number of the unemployed is expected at the level of 7.5% a month as compared to the same period of 2012.
